

## 15 - Tracks Part 3 - Other tracks

We have just looked at the 6 types of tracks available in Logic. However there are more options when creating tracks. These are under the 'Other' section of the Track menu

Choosing New Track with Duplicate Settings will create a brand new, totally independent track, with the same routing, insert, sends and values of which ever track you have selected. Neither regions, nor automation, will be copied, just the track.

Use a New Track with Same Instrument if you want to have the same instrument in two different tracks. This is like having the same track more than once, so it will not consume more computer resources. Therefore, this is a great way to save on computer processing power and avoid system overloads.

Let me put an example: Imagine you want the right and left hand of the piano to be in different tracks. Instead of loading two virtual pianos, load only one, and duplicate the track with Same Instrument.

When you have overlapped regions you can easily put the regions in different tracks without having to consume more processing power. Do this by selecting New Track for Overlapped Regions. If you want specific regions to move to the new track select New Track for Selected Regions. For these two options Logic will automatically create New Tracks with Same Instrument.

Notice how if I change something in one track it automatically changes in the other one, proving how these tracks are basically the same.
