

## 6-The Toolbar - Part 3

Use Remove Silence to automatically cut the silence out of any selected audio region.

It can also be found in the Audio File editor, under the Track tab and the Functions menu.

The Join button will join separated regions or notes together.

I like to set it as a key command, given that is very useful. But there is something you must know first: Although this function seems to be convenient, it is not, because it will join anything into the same region, no matter if the regions are in separate tracks. This means that the notes from many different instrument tracks will join in only one track, totally inconvenient.

In order to avoid this, use a key command instead of using the Join function in the Toolbar. However, make sure that you use a key command for “Join Regions per Tracks” instead of “Join region”. Open your key commands window and change it.

Move regions from one track into another, by selecting the track you want to put the region on, then selecting the region to move, and clicking on the Toolbar function called “Move to track”.

Move the region in same track by clicking on Move to Playhead. The region will move to the location of the playhead.
