

## 17-Track Stacks - Folder Stacks

Organize your session by stacking tracks together using Track Stacks. There are 2 types of Track Stacks: A Folder Stack and a Summing Stack. Let's look at folder stacks:

A Folder Stack is used to mute, solo, and control the volume of all the tracks inside the stack.

A Folder Stack has no input or output, so when creating it, it will not change the output in the tracks contained inside of it.

A Folder Stack may look similar to Logic's Folders ([Right click region > Folder > Pack Folder](#)) but it is actually quite different. Folders work with regions. In other words, to create a folder you need to select a region. On the other side, a Folder Stack is independent to the regions, therefore you can create a Folder Stack without having created any regions in advance.

Folder Stacks are much more useful when trying to organize your session. This is because they don't duplicate tracks. When you create a Folder, you may get duplicate tracks, in other words, the tracks will exist both next to the Folder and inside of it.

As you can see, after I create this Folder, the tracks are still both next to the new Folder track, and inside the Folder track.

Note that they are actually the same track. Any changes in one place will show in the other too.

This can be quite confusing and does not happen with Folder Stacks.
