

8-The Toolbar - Part 5

Set Locators to match the length and location of a region by selecting a region and clicking on the Set Locators button of the toolbar.

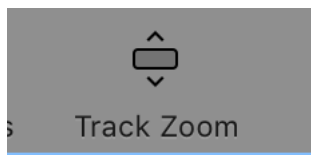

If you want to avoid doing this every time, and instead, you want Logic to set the locator automatically to match the length and location of any selected region, then you will have to turn on Autoset Locators by right clicking on the cycle button and selecting Auto Set Locators by Region Selection.

Track Zoom will automatically zoom the track selected leaving the rest untouched.

However, there is another zoom tool in the Toolbar. The Zoom function is actually called “Toggle Zoom to fit Selection or All Contents”. It will zoom the selected region until that region fills the whole sequencer in the Main window. This is extremely useful for editing purposes, and a key command should be set, in order to be able to zoom in and out instantly while editing audio.

Zoom to fit Locators, store Navigation Snapshot	
Zoom to fit All Contents, store Navigation Snapshot	
Toggle Zoom to fit Selection or All Contents	Z
Toggle Horizontal Auto Zoom	
Toggle Vertical Auto Zoom	

There are 2 other zoom functions that can not be found in the Toolbar but I find very convenient. These are: The Vertical Auto Zoom and the Horizontal Auto Zoom. You should set a key-command for these too.
